

# SISG 2022 - Module 2

## Introduction to Genetics and Genomics

### Molecular Biology

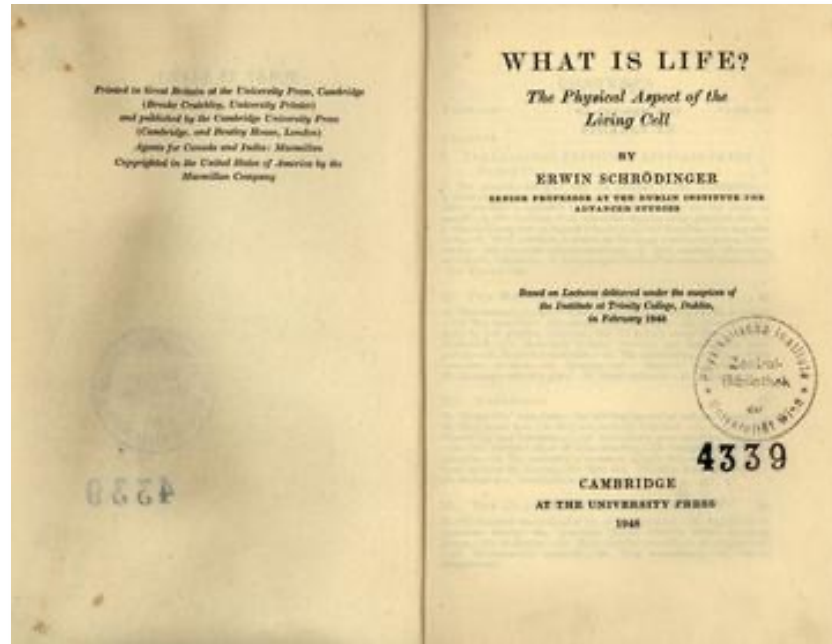

4pm EDT, Monday, July 11<sup>th</sup>

Joe Lachance and Greg Gibson

[joseph.lachance@biology.gatech.edu](mailto:joseph.lachance@biology.gatech.edu)

# What are genes made of?

- What is the hereditary molecule?
- Schrödinger incorrectly suggested that genetic information is contained in the form of aperiodic crystals

# DNA is the transforming factor

- Avery, MacLeod, and McCarty (1944)
- DNA from virulent type S bacteria is able to transform nonvirulent type R bacteria

# DNA is the hereditary material

T2 phage infects *E. coli*

Hershey and Chase (1952)

# Watson and Crick: double helix structure of DNA

*Photo 51: X-ray diffraction of DNA  
(Gosling and Franklin)*

# Information and genetics

- How much information is contained in DNA?
  - 133 base pairs  $\rightarrow 4^{133}$  possibilities
  - $4^{133} = 10^{80}$  (the number of atoms in the universe)
- Information flow in genetics: genotype  $\rightarrow$  phenotype

# Genotype-phenotype map

# Central Dogma of Molecular Biology\*

\*Things are not quite this simple!

*What are some exceptions to the Central Dogma?*

# Central Dogma: implications

- Mendelism vs. Lamarckism (acquired characteristics)
- Germline vs. soma (Weismann)
- Genes as information - decoupling of structure and function
- Biological “laws” are full of exceptions

# RNA world

# DNA

Figure 2.4b Human Evolutionary Genetics, 2nd ed. (© Garland Science 2014)

Figure 2.5 Human Evolutionary Genetics, 2nd ed. (© Garland Science 2014)

# 5' to 3'

- The structure of DNA is a double helix that looks like a twisted ladder
- The sides of the ladder are made of alternating sugar (deoxyribose) and phosphate molecules, while the steps of the ladder are made of nucleobases
- The two DNA strands are antiparallel to each other

# DNA packaging

Figure 2.11 Human Evolutionary Genetics, 2nd ed. (© Garland Science 2014)

# Chromatin and TADs

- Chromosomes are not visible during most of the cell cycle
- Chromatin is in its least condensed state during interphase
- TAD: topologically associating domains

# DNA packaging: implications

- Exposed DNA is more likely to be functional
- Proximity in 3D space matters
- Histone code

# Ploidy

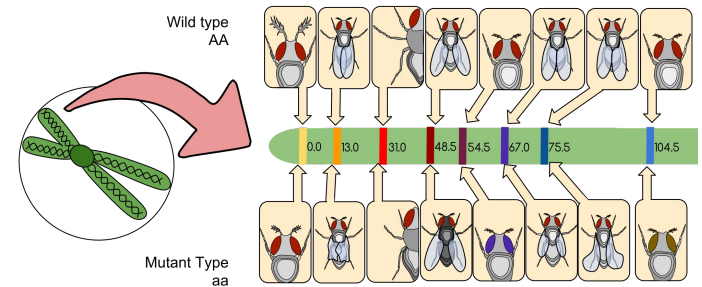

# Recombination

- Recombination occurs in meiosis
- It is a byproduct of the need to pair homologous chromosomes

# Recombination: implications

- Genetic maps and linkage disequilibrium

- Benefits of sex

Sexual reproduction  
(recombination)

Asexual reproduction

# DNA replication

- Stages: initiation, elongation, and termination

# DNA replication: implications

- Semi-conservative replication
- 5' → 3' directionality causes problems (solved by evolution)
- Potential for miscopying → **mutations**
- Comparative genomics

# Transcription factors and gene regulation

# RNA comes in many different flavors

- mRNA: messenger RNA
- tRNA: transfer RNA
- rRNA: ribosomal RNA
- Regulatory RNAs (miRNA, siRNA, piRNA)

# Proteins are made of amino acids

**Chart Key:** ● ALIPHATIC ● AROMATIC ● ACIDIC ● BASIC ● HYDROXYLIC ● SULFUR-CONTAINING ● AMIDIC ○ NON-ESSENTIAL ○ ESSENTIAL

**Note:** This chart only shows those amino acids for which the human genetic code directly codes for. Selenocysteine is often referred to as the 21st amino acid, but is encoded in a special manner. In some cases, distinguishing between asparagine/aspartic acid and glutamine/glutamic acid is difficult. In these cases, the codes asx (B) and glx (Z) are respectively used.

# From DNA to RNA to protein

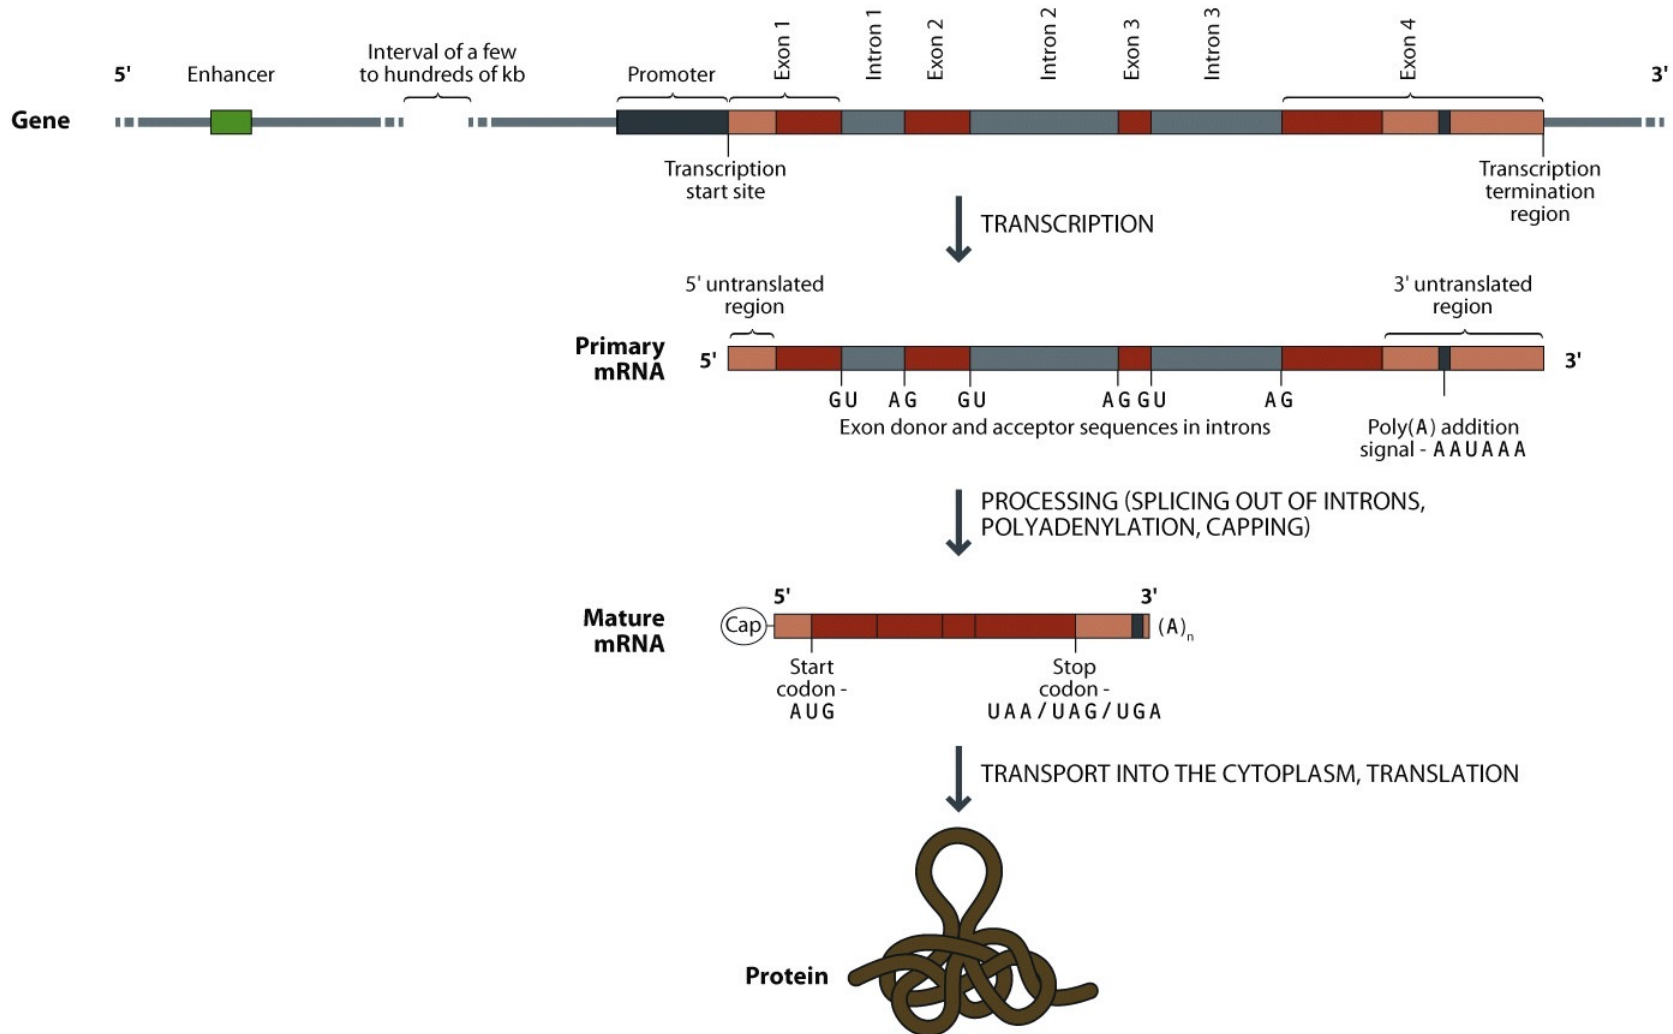

Figure 2.6 Human Evolutionary Genetics, 2nd ed. (© Garland Science 2014)

# Transcription: DNA serves as a template

3' ... GCTAGCCTGATGCCTGATCGCTGATGCT ... 5'

**Sense strand of DNA**

**Antisense strand of DNA**

**Transcription of  
antisense strand**

5' ... CGAUCGGACUACGGACUAGCGACUACGA ... 3'

**RNA**

# Transcription (DNA to RNA)

- Major steps: initiation, promoter escape, elongation, and termination

# Splicing

# Transcription: implications

- **Gene expression:** transcriptional activity of a gene that results in RNA
- Inducible system that allows organisms to respond to environments
- Helps explain how different cell types can share same DNA

# Translation (RNA to protein)

- Stages: initiation, elongation, and termination

# The genetic code

		Seond letter

*Does the codon table look random?*

# Translation: implications

- The genetic code is (relatively) arbitrary... frozen accident?
- Phase and frameshift mutations
- Post-translational modifications (e.g., glycosylation)
- **Enzymes:** a substance produced by a living organism that catalyzes a specific biochemical reaction. Enzymes are made of proteins

# Building blocks of life

- Carbohydrates
- Proteins
- Lipids
- Nucleic acids

# From biochemistry to dominance and recessivity

- Kacser and Burns (*Genetics*, 1981)
- Dominance can arise as an emergent property of metabolic flux

- Having half as much of an enzyme is much better than having none
